What is claimed is:

- 1. A method of producing a silica dielectric film comprising
- 5 (a) preparing a composition comprising a silicon containing pre-polymer, optionally water, and optionally a metal-ion-free catalyst selected from the group consisting of onium compounds and nucleophiles;
 - (b) coating a substrate with the composition to form a film,
 - (c) crosslinking the composition to produce a gelled film, and
- (d) heating the gelled film at a temperature of from about 750 °C to about 1000 °C and for a duration effective to remove substantially all organic moieties and to produce a substantially crack-free, and substantially void-free silica dielectric film.
- 15 2. The method of claim 1 wherein the composition of step (a) comprises water.
 - 3. The method of claim 1 wherein the composition of step (a) comprises a metalion-free catalyst selected from the group consisting of onium compounds and nucleophiles.

- 4. The method of claim 1 wherein the resulting silica dielectric film has a density of from about 2 to about 2.3 g/milliliter.
- 5. The method of claim 1 wherein step (d) is conducted at a temperature of from about 900 °C to about 1000 °C.
 - 6. The method of claim 1 wherein step (d) is conducted for from about 30 minutes to about 120 minutes.

7. The method of claim 1 wherein step (d) comprises heating the film at a temperature ranging from about 900 °C to about 1000 °C, for a time period ranging from about 45 minutes to about 75 minutes.

5

- 8. The method of claim 1 wherein the catalyst is selected from the group consisting of ammonium compounds, amines, phosphonium compounds and phosphine compounds.
- 9. The method of claim 1 wherein the catalyst is selected from the group consisting of tetraorganoammonium compounds and tetraorganophosphonium compounds.
- 10. The method of claim 1 wherein the catalyst is selected from the group consisting of tetramethylammonium acetate, tetramethylammonium hydroxide, tetrabutylammonium acetate, triphenylamine, trioctylamine, tridodecylamine, triethanolamine, tetramethylphosphonium acetate, tetramethylphosphonium hydroxide, triphenylphosphine, trimethylphosphine, trioctylphosphine, and combinations thereof.

- 11. The method of claim 1 wherein the composition further comprises a non-metallic, nucleophilic additive which accelerates the crosslinking of the composition.
- 25 12. The method of claim 1 wherein the composition further comprises a nucleophilic additive which accelerates the crosslinking of the composition, which is selected from the group consisting of dimethyl sulfone, dimethyl formamide, hexamethylphosphorous triamide, amines and combinations thereof.

- 13. The method of claim 1 wherein the composition comprises water in a molar ratio of water to Si ranging from about 0.1:1 to about 50:1.
- 5 14. The method of claim 1 wherein the composition comprises a silicon containing prepolymer of Formula I:

- wherein x is an integer ranging from 0 to about 2, and y is x-4, an integer ranging from about 2 to about 4;
 - R is independently selected from the group consisting of alkyl, aryl, hydrogen, alkylene, arylene, and combinations thereof;
- L is an electronegative moiety, independently selected from the group consisting of alkoxy, carboxyl, acetoxy, amino, amido, halide, isocyanato and combinations thereof.
- 15. The method of claim 14 wherein the composition comprises a polymer formed by condensing a prepolymer according to Formula I, wherein the number
 20 average molecular weight of said polymer ranges from about 150 to about 300,000 amu.
- 16. The method of claim 1 wherein the composition comprises a silicon containing pre-polymer selected from the group consisting of an acetoxysilane, an ethoxysilane, a methoxysilane, and combinations thereof.

- 17. The method of claim 1 wherein the composition comprises a silicon containing pre-polymer selected from the group consisting of tetraacetoxysilane, a C₁ to about C₆ alkyl or aryl-triacetoxysilane, and combinations thereof.
- 5 18. The method of claim 16 wherein said triacetoxysilane is methyltriacetoxysilane.
- 19. The method of claim 1 wherein the composition comprises a silicon containing pre-polymer selected from the group consisting of tetrakis(2,2,2-trifluoroethoxy)silane, tetrakis(trifluoroacetoxy)silane, tetraisocyanatosilane, tris(2,2,2-trifluoroethoxy)methylsilane, tris(trifluoroacetoxy)methylsilane, methyltriisocyanatosilane and combinations thereof.
- 20. The method of claim 1 wherein the step (c) crosslinking is conducted at a temperature which is less than the heating temperature of step (d).
 - 21. The method of claim 1 wherein the step (c) crosslinking comprises heating the film at a temperature ranging from about 100 °C to about 250 °C, for a time period ranging from about 30 seconds to about 10 minutes.

20

- 22. The method of claim 1 wherein the composition further comprises a solvent.
- 23. The method of claim 1 wherein the composition further comprises a solvent in an amount ranging from about 10 to about 95 percent by weight of the composition.
- 24. The method of claim 1 wherein the composition further comprises a solvent having a boiling point ranging from about 50 to about 250°C.

25. The method of claim 1 wherein the composition further comprises a solvent selected from the group consisting of hydrocarbons, esters, ethers, ketones, alcohols, amides and combinations thereof.

5

26. The method of claim 25 wherein the solvent is selected from the group consisting of di-n-butyl ether, anisole, acetone, 3-pentanone, 2-heptanone, ethyl acetate, n-propyl acetate, n-butyl acetate, ethyl lactate, ethanol, 2-propanol, dimethyl acetamide, propylene glycol methyl ether acetate, and combinations

10 thereof.

- 27. A dielectric film produced on a substrate by the method of claim 1.
- 28. A semiconductor device comprising a dielectric film of claim 27.

- 29. The semiconductor device of claim 27 that is an integrated circuit.
- 30. A method of forming isolation structures in a semiconductor substrate comprising:
- a) etching trenches in a semiconductor substrate, thereby forming substantially 20 unetched areas of said substrate between said trenches;
 - b) depositing a conformal fill composition that substantially fills said trenches and to form a film, said composition comprising a silicon containing pre-polymer, optionally water, and optionally a metal-ion-free catalyst selected from the group
- 25 consisting of onium compounds and nucleophiles;
 - (c) crosslinking the composition to produce a gelled film, and
 - (d) heating the gelled film at a temperature of from about 750 °C to about 1000 °C and for a duration effective to remove substantially all organic moieties and to

produce a substantially crack-free, and substantially void-free silica dielectric film.

- e) optionally planarizing said silica dielectric film.
- 5 31. The method of claim 30 wherein step e) is conducted.
 - 32. The method of claim 30 wherein step e) is conducted by polishing said silica dielectric film by chemical mechanical polishing.
